New, super-efficient microwave assist firing.

In 2007, Harrop, under license from Ceralink, designed and built this 27 ft³ 1600°C atmosphere elevator kiln, the first large scale kiln with microwave assist technology.

Only from Harrop!

- Heating times reduced up to 80%
- Energy use cut by up to 60%
- Lower processing temperatures
- Smaller carbon footprint
- Enhancement of properties

These are the benefits of Microwave Assist Technology (MAT), proven after years of field testing. MAT combines conventional gas or electric radiant heat with a relatively small amount of microwave energy. The microwaves

target the core of the product, while the conventional heat provides thermal balance and uniformity to the product surface.

Harrop is the exclusive North American licensee of industrial microwave assisted kilns and furnaces.

Welcome to PACRIM 8 in Vancouver!

Welcome to the 8th Pacific Rim Conference on Ceramic and Glass Technology (PACRIM 8) in the great city of Vancouver! This conference is the eighth in a series of international conferences that provided a global forum for presentations and information exchange on the latest emerging ceramic and glass technologies. The conference series began in 1993, and was last organized by the American Ceramic Society in 2005, in Maui, Hawaii. Over the years, PACRIM conferences have established a strong reputation for state-of-the-art presentations and information exchange on the cutting-edge ceramic and glass technologies. They have facilitated global dialogue and discussion with leading global experts, practitioners, and end-users.

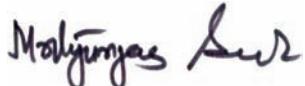

The plenary session entitled "Global Megatrends: Challenges and Opportunities for Ceramics" will generate important discussion on where each particular field is heading on a global scale. The technical program will include more than 1050 state-of-the-art presentations from more than 41 countries (invited and contributed talks and posters) and information exchange on the latest emerging ceramic technologies. We hope to provide excellent opportunities to facilitate global dialogue and discussion with leading world experts. It will also provide a forum for knowledge sharing and for making new contacts with peers from different continents.

An International Fulrath Symposium on the role of new ceramic technologies for sustainable society has been organized in honor of Professors N. Ichinose and R.C. Bradt, who have made tremendous contributions to the Richard M. Fulrath award program and tirelessly promoted the friendship among Japanese and U.S. researchers.

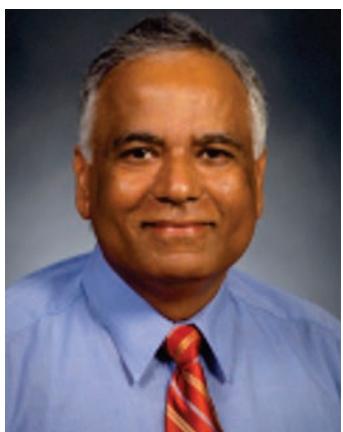

I would also like to welcome the delegates from the International Commission on Glass (ICG) and International Ceramic Federation (ICF), as well as members from the Glass and Optical Materials Division and other divisions of The American Ceramic Society.

I would like to invite all of you to take advantage of this unique opportunity to visit the great city of Vancouver and actively participate in this conference. We hope to provide an excellent forum for interaction and developing friendships with participants from various continents, who are involved in research, development, engineering, manufacturing, and application of ceramic and glass materials.

I am looking forward to seeing all of you in Vancouver!

Presentation Abstract:

2009 Global R&D and Innovation in Glass and Ceramics at Corning

Corning's approach to growth through innovation is focused on the invention and manufacture of high technology keystone components from inorganic materials. Several new product programs in the innovation portfolio will be reviewed. The critical success factors of Corning's global innovation strategy will be discussed as well as our methodology for tracking mega-trends and identifying new opportunities in glass and ceramics.

Corning's approach to and perspective on R&D in Asia for glass and ceramics materials will be highlighted.

Presentation Abstract:

Research on Ceramics: State of the Art and Future Challenges in Japan

Ceramic materials research has continued to expand since the mid-19th century. Through the research on semiconductors from the mid-20th century, ceramics today are used not only as structural materials but also as functional materials. In addition, there is no doubt that nanotechnology contributes to the progress of research on ceramic materials. Since United States launched its National Nanotechnology Initiative in 2000, nanotechnology has been promoted world wide, and has affected all materials research, including ceramics. As a result, people have discovered that even ceramics are capable of superconductivity. In Japan, although the net research budget for nanotechnology and materials science decreased in 2008, research in the field is still one of the four strategic fields of the third Basic Program for Science and Technology operating from 2006 to 2011.

Japan has promoted the materials research focusing on (1) development of human resources and their education, (2) promoting the Center of Excellence and networking and

(3) commercialization of research products. These promotions effectively create seeds of innovations in the area of ceramic materials, such as the discovery of the third group of super-conductive materials and achievements in the area of oxide electronics. Japanese ceramics industries have played an important role in the development of ceramics technology. Multilayer capacitors, called MLCCs, are such an example. Although the MLCC idea originated in the U.S., the Japanese industry led the effort to put it into practical use. Indeed, Japanese makers retain more than 50 percent of the MLCC market.

However, Japanese business executives today are not optimistic about their future. To maintain a leading role, they are demanding new materials, novel processes and new concepts from our academy. Supporting their needs is one of missions of the National Institute.

Teruo Kishi

Teruo Kishi is currently president of the National Institute for Materials Science and of The Japan Federation of Engineering Societies. He is professor emeritus at the University of Tokyo, and director general of the Nanotechnology Researchers Network Center of Japan. Kishi's expertise includes material science, fracture and non-destructive testing, metals and ceramics composites. In 2007, he received the Barkhausen Award, which is given for outstanding research achievements in interdisciplinary work involving physics, materials science, and electrical engineering. Kishi received his doctor of engineering from the University of Tokyo in 1969.

Plenary Speakers

11:20 AM
Larry L. Hench
University of Florida
United States

Presentation Abstract:

Discovery and Clinical Uses of Bioglass: A 40 Year Retrospective

Bioactive glasses were discovered in 1969 and provided, for the first time, an alternative to first generation bioinert materials: a second generation, interfacial bonding of an implant with host tissues. Tissue regeneration using the gene-activating properties of 45S5 Bioglass provide a third generation of biomaterials that are designed to turn-on the body's own repair processes. Forty years of studies of mechanisms of bone-bioactive glass bonding and recent discoveries of gene-activation by the ionic dissolution products of bioglass are described, including ionic stimulation of stem cells. Clinical uses in 35 countries cover a wide range of medical and dental

applications: middle ear prostheses, endosseous ridge implants, maxillo-facial reconstruction, spinal fusion, scoliosis repair, bone grafting, repair of fracture dis-unions and filling of cavitary defects. Implications for future use in regenerative medicine will be summarized.

Larry L. Hench

Larry L. Hench is currently a graduate research professor in the Department of Materials Science and Engineering at the University of Florida. He is also professor and director of special projects at the University of Central Florida, visiting professor of materials science and engineering at the University of Arizona, and emeritus professor of ceramic materials in the Department of Materials at Imperial College London. For 10 years he served as codirector of the Imperial College Tissue Engineering and Regenerative Medicine Centre. He assumed the chair of ceramic materials at Imperial College in 1995 following 32 years at the University of Florida where he served as director of the Bioglass Research Centre and codirector of the Advanced Materials Research Center. He re-joined the faculty of the MSE department at UF in 2009. Larry completed his Bachelor of Ceramic Engineering degree at The Ohio State University in 1961 and his Ph.D. in 1964.

Tutorials on Thermodynamics & Chemical Technology in Glass Melting

Wednesday, June 3rd

8:30 AM – 12:00 PM

Regency E

The tutorial addresses Master level or 1st year Ph.D. students with a focus on glass science and technology. Students may have acquired a background in materials science of glass, and may have gained an overview over glass fabrication processes. But often, they feel a lack of instruction in the theoretical background and the general concepts of industrial high-T processes. The tutorial aims at closing this gap. It is true, the tutorial cannot replace an entire course. But it will convey the meaning of the important buzz words, and help to gain some practice in applying the related concepts. The following four lectures – comprising calculation exercises – are offered:

1. Thermochemistry of Mineral Raw Materials, Glass Melts, and Solid Glass
2. Thermochemistry of Combustion
3. The Glass Furnace – a Thermal Reactor
4. The Glass Furnace – a Chemical Reactor

An Introduction to

Northwestern Polytechnical University

Northwestern Polytechnical University (NPU) is China's only research-oriented, multi-disciplinary, and international university of science and technology, which simultaneously excels at Aeronautics, Astronautics, and Marine Engineering. The University emphasizes science and technology, while harmoniously developing the fields of manage-

NPU's campus covers an area of 5,100 mu (about 340 hectares), offers 54 undergraduate programs, 101 graduate programs, 57 doctoral programs, and is home to 12 postdoctoral research stations. It also has the authority to confer MBA and Master of Engineering Degrees.

Currently, NPU has 3,500 full and associate professors and senior engineers, among whom there are 15 academicians of the Chinese Academy of Engineering and Chinese Academy of Science, 4 foreign academicians, 13 Yangtze River Scholars and 380 Ph.D. advisors.

Since its founding, NPU has trained more than 140,000 students, including 3,000 Ph.D.'s and 15,000 Master's degree holders. Among them are the country's first Ph.D. students in six different disciplines, and the first test pilots with Master's Degrees. 34 Ph.D. students and teachers of the University have become research fellows of Alexander Humboldt, and six NPU graduates are the recipients of the Chinese Ten Outstanding Youths title.

NPU has become an important center for scientific innovation. It has 10 key state disciplines, 13 first-class disciplines with the authority of conferring doctoral degrees, 10 key national laboratories, and national specialized laboratories, 26 key provincial and ministerial laboratories, and 9 provincial engineering research centers. Scientific research is one of the great strengths of NPU. The main indexes of its research are among the top Chinese universities.

NPU has successfully undertaken more than 5,780 national research projects during the "Tenth Five-year Plan" (2001-2005). More than 300 national, provincial and ministerial awards have been granted to the University for its excellent research

achievements, of which 10 are State Awards for Science and Technology Accomplishments. In 2004, the project, "Processing of Continuous Fiber Reinforced Silicon Carbide Matrix Composites for High-Temperature and Long-Time Applications," achieved the

first-class State Technology Invention Award. The University's research fund has ranked in the top 10 in size among funds in Chinese universities for the past six years. In 2007, the research fund was up to 1197 million RMB, which ranked fifth in China.

The predecessors of Northwestern Polytechnical University were the State Northwestern Engineering College (formed in 1938 from the unification of Beiyang Engineering College, the Engineering College of Peking University, the Engineering College of Northeast University and Jiaozuo Engineering College), and Huadong Aeronautical College (formed in 1952 from the unification of the Aeronautical Engineering Department of Jiaotong University, the Aeronautical Engineering Department of Nanjing University, and the Aeronautical Engineering Department of Zhejiang University). The State Northwestern Engineering College and Huadong Aeronautical College joined to form Northwestern Polytechnical University in 1957. In 1970 the Engineering Department of Harbin Engineering College was merged into Northwestern Polytechnical University.

NPU was one of the key national constructions of "Project 985" during the "Tenth Five-year Plan" (2001-2005). It was also one of the first Chinese universities to establish graduate schools and university science parks.
