WELCOME

Dear Colleagues and Friends,

Welcome to the Materials Challenges in Alternative & Renewable Energy Conference (MCARE 2018), organized by The American Ceramic Society (ACerS) and the Korean Institute of Chemical Engineers (KIChE). MCARE 2018, celebrating its 10th year, is a premier forum to address opportunities of emerging material technologies that support sustainability of a global society. MCARE 2018 brings together leading global experts from universities, industry, research and development laboratories, and government agencies to interact collaboratively and communicate materials technologies that address development of affordable, sustainable, environmentally friendly, and renewable energy conversion technologies.

There will be four plenary sessions, one to begin each day. Details of about each plenary lecture can be found on page iii. In addition, the conference includes technical sessions that address challenges and solutions in the areas of direct thermal-to-electric energy conversion and thermal energy harnessing; advanced electrochemical materials including batteries; spectral conversion materials; solar fuel production; next generation solar cell technology; solid oxide fuel cells and high temperature electrolysis; materials and processes for sustainable nuclear energy; lifecycle considerations of materials; and, super ultra-low energy and emission vehicles.

We are happy that you are here, appreciate your participation, and hope you enjoy the meeting.

Super Ultra Low Energy and Emission Vehicle Center (SULEEV)

Director's Greetings

SULEEV (Super Ultra Low Energy and Emission Vehicle) Center, funded by Ministry of Science and ICT, was launched on June, 2016. The center is focused on convergence research with a purpose of realizing commercialization of high-efficiency vehicles and gas exhaust purification systems. We look forward to continued support and encouragement for our ongoing research projects.

Ph.D. Kwan-Young Lee
Professor of Korea University
Department of Chem. Biol. Eng.

Center Introduction

Research efforts at SULEEV Center are devoted to developing new emission purification system capable of high performance at lower temperatures. To achieve this, the center will be conducting research for the next seven years until 2022 (1st stage for the first four years, 2nd stage for the remaining three years) with funding from the Korean government and participating companies.

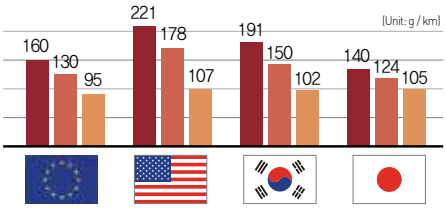
Beside Professor Kwan-Young Lee, the Director, total of 10 professors, including four professors from the Department of Chemical and Biological Engineering at Korea University, and six professors from Kangwon National University, Seoul National University, Chonnam National University, POSTECH, and KAIST, will lead and constitute research efforts at the SULEEV center.

During the development of new emission purification system, the SULLEV center will also collaborate with seven companies (Hyundai Motor Company, Heesung Catalysts Co., Blueplanet Co., Ceracomb, CBB Co., EnD Solutions, and ClueLife) to test reliability and successfully push for commercialization of new emission purification system.

Background

① New Regulation on Automobile CO_2 Emission

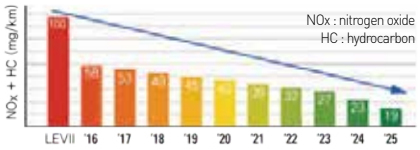
- Reduction of CO_2 emission is critical for efforts to minimize global warming.
- To achieve this, many nations plan to impose harsher restriction policies on automobile fuel efficiency and CO_2 emission rate.



▶Improvements in fuel efficiency and decrease in CO_2 emission rate is essential.

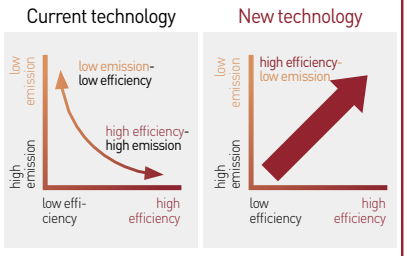
② More Stringent Regulation on Automobile Exhaust Gas and Pollutants

- Pollutants, such as nitrogen oxide (NOx), particulate matter (PM), carbon monoxide (CO), and hydrocarbons (HC) are produced as parts of automobile exhaust gas.
- Restriction policy against such pollutant is also expected harsher around many different nations.



▶There is now great need for much improved exhaust gas purification system.

Development of New System with High Energy Efficiency-Low Emission

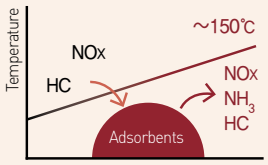


※Benefit of High-efficiency combustion engines: reduction of exhaust gas temperature

▶Catalyst purification system capable of being active at 150℃ is required!

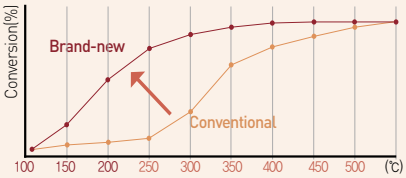
Objective

① Solution for Cold-Start Problem



Development of temperature-dependent adsorbent designed to only adsorb pollutants at low temperature and desorb at high temperature where catalyst is active

② Development of Catalyst Capable of Low-temperature Oxidation/Reduction and PM Combustion



Development of catalyst capable of oxidation/reduction around 150℃ and PM combustion below 400℃ using computational tools and nano technology

③ Development of Novel Aftertreatment System

· Analysis of catalysts deactivation mechanism and development of methods to improve catalyst durability
· Development of slurry-coating technology to effectively coat catalysts/absorbents along the filters
· Derivation of integrated control and diagnosis algorithm
